Air to water heat pumps, or air source heat pumps work by like a refrigerator only in reverse. The system draws in air from outside of the building an once it arrives into the heat exchanger, the refrigerant absorbs the latent heat from outside and the air evaporates.

How does an air to water heat pump work? An air to water heat pumps system consist of four major elements that allow the refrigerant to pass from the liquid state to the gas: a compressor, a condenser, an expansion valve and an evaporator. 1. A fan passes air over the evaporator, the refrigerant absorbs heat from the outside
