That limit is called the solubility of the substance. For example, in a liter of solution, the maximum amount of CaSO_4 dissolved is 0.667 grams, which is 0.0049 moles of that solute. Therefore, the solubility of calcium sulfate may be reported either as 0.667 grams per liter or as 0.0049 M.

M.Dyna Mix Studies of Solvation, Solubility and Permeability

Solubility of drug molecules and their permeability across lipid membranes have been studied using M.DynaMix by calculating logP partition coefficients from the solvation free energies (Lyubartsev et al. 1999; Åberg et al. 2004). 3.2 Solvation in mixed solvents Many substances turn out to be readily soluble in solvent mixtures (mixed solvents) but not in the pure components and vice versa (Reichardt, 1988).

The second conceptual step is solvation, which corresponds to the force of the solute-solvent intermolecular attraction that needs to be formed in order to form a solution. Many intermolecular forces can contribute to solvation, including hydrogen bonding, dipole -dipole forces, Van Der Waals forces, and ion -dipole interactions.

Solvation describes the interaction of solvent with dissolved molecules. Both ionized and uncharged molecules interact strongly with solvent, and the strength and nature of this interaction influence many properties of the solute, including solubility, reactivity, and color, as well as influencing the properties of the solvent such as the viscosity and density.
