Complex analysis, traditionally known as the theory of functions of a complex variable, is the branch of mathematical analysis that investigates functions of complex numbers. It is useful in many branches of mathematics, including algebraic geometry, number theory, analytic combinatorics, applied mathematics; as well as in physics, including the branches

Complex Analysis -- from Wolfram MathWorld

Complex analysis is the study of functions that live in the complex plane, that is, functions that have complex arguments and complex outputs. The main goal of this module is to familiarize ourselves with such functions.

For a non-zero complex number z we denote by $\arg(z)$ the set of its arguments, i.e. the set of real numbers θ such that $z = r(\cos\theta + i\sin\theta)$. The pair of numbers (r, θ) for $\theta \in \arg(z)$ are also called polar coordinates for the complex number z . More about this will be discussed in Section 5.
