Both light and sound travel as waves. Sound waves must be transmitted through some kind of medium whether it is a solid, liquid, or gas. Light does not need a medium to propagate. Thus, in the vacuum of outer space, you can see but not hear. In this unit, you will learn many interesting facts about waves, sound ,and light.

Light, unlike sound, can travel through a vacuum: if you're reading this by sunlight, you're taking advantage of light that had to make it through millions of miles of vacuum to get to you. Waves, then, are not just a trick that vibrating atoms can do. Waves are one of the basic phenomena of the universe.

Waves are created by a vibration. As a wave moves through a medium, the individual particles of the medium move from the source of the wave to another location some distance away. Waves are a means of transporting energy from one location to another without actually displacing matter from one location to another.

This dependence on frequency didn't make any sense in terms of the classical wave theory of light. A light wave consists of electric and magnetic fields. The stronger the fields, i.e., the greater the wave's amplitude, the greater the forces that would be exerted on electrons that found themselves bathed in the light.
