CHAPTER 8: ANALOG FILTERS SECTION 8.1: INTRODUCTION Filters are networks that process signals in a frequency-dependent manner. The basic concept of a filter can be explained by examining the frequency dependent nature of the impedance of capacitors and inductors. Consider a voltage divider where the shunt leg is a reactive impedance.

The Butterworth filter design can be implemented digitally based on two methods matched z-transform and bilinear transform. An analog filter design can be discretized using these two methods. If we consider Butterworth filter which has all-pole filters, then both the methods impulse variance and matched z-transform are said to be equivalent.
