changing magnetic field in the conductor according to Faraday's law of induction. Eddy currents flow in closed loops within conductors, in planes perpendicular to the magnetic field. They can be induced within nearby stationary conductors by a time-varying magnetic field created by an AC electromagnet or transformer, for example, or by relative motion between

Zetec Eddy Current technology and products provide a fast efficient solution for near surface anomalies in conductive material. A magnetic field from a coil is induced into conductive material where anomalies in the material create changes to the “eddy currents” that are sensed for evaluation by specialized instrumentation.
