The sensor and controller relationship can be represented as a networked control system with inputs (sensors' data) and outputs (control commands) [2]. As shown in Fig. 8.2, a wireless sensor and controller (WSCN) with delay and packet loss can be used to describe a CPS. It has state transitions based on the control results from $T \rightarrow T + 1$.

Qianfan Xin, in Diesel Engine System Design, 2013. 14.9.1 Classification of engine sensors. The model-based controls of valves and turbochargers mentioned above are essentially about actuators. In their equations, it is noted that the engine temperature, pressure, and flow parameters can be from either actual measurement or virtual sensor modeling.

A MAP sensor is one of the electronic controls listed in a group known as pressure sensors. It analyzes the pressure of vacuum created when the fuel mixture passes through the intake manifold. Then, it emits a signal that helps the Engine Control Module (ECM) make adjustments that affect internal combustion.

Automotive Applications: Major uses for variable reluctance sensors include engine crankshaft and camshaft rotational control of spark timing, fuel injection timing and engine speed measurement, and for control of transmission input and output shaft speeds for electronically controlled gear shifting. Another major application for variable reluctance sensors is wheel speed, on all four wheels (for the ABS anti-lock brake system, traction control and vehicle stability).

Besides, the engine sensors provide the Engine Management System with vital data parameters in real-time. These engine sensors continuously monitor the engine parameters. They also provide the ECU with changes that occur in the data from time to time. Based on these inputs, the ECU recalculates the correct air-fuel ratio and ignition timing.

The engine control module (ECM) is also known as the powertrain control module (PCM) or the engine control unit (ECU). The main responsibility of this controller is to get information from sensors and run certain actuators. In the case of any errors, the ECU shows a check engine light on your dashboard.

A permanent magnet crankshaft position sensor is located behind the harmonic balancer or directly on the engine block. Engine coolant temperature sensors or (ECT) sensors are variable resistors that use resistance to alter a 5-volt reference signal from the PCM. The sensor's signal changes according to the engine's coolant temperature.
