Mannich bases HL1 and HL2 derived from lawsone, heptylamine and 3-formylcoumarins have been synthesized for the investigation of their photophysical properties. The cyclic voltammetry data showed a charge transfer (CT) process from the coumaryl to the naphthoquinonoid group, in spite of the absence of conjugation between these two fragments, with the nitrogen atom playing an important role.

The investigation of their photophysical and electrochemical properties has been carried out. Although almost identical absorption and emission spectra were obtained in dilute chloroform solution for all polymers 1-3, the full width at half-maximum (fwhm) value of the emission curves depends on the length of the attached side chains.

In this study we report a theoretical comparative study of some photophysical properties in the [Ru(bpy)3-x(dab)x]2+ (x = 0-3) series. Density functional theory calculations, validated by highly correlated ab initio benchmark calculations, were used to investigate the absorption and emission properties of the complexes with x = 1-3.
