appliance reduces the overbite by encouraging forward growth of the lower jaw. It uses 2 removable block-type appliances that fit together like a puzzle. It must be worn full-time to retrain the jaw muscles to hold the lower jaw in the new, more forward position, and to achieve the desired jaw change.

developed by Harold Kesling in 1944 in order to aid the orthodontic treatment during the finishing stage.

List of orthodontic functional appliances - Wikipedia

The transpalatal bar helps to maintain the width of the dental arch. We commonly use this appliance for patients who have an impacted permanent tooth, and exposure of that tooth is suggested. The lingual arch is a metal bar that is attached to the tongue side of the lower first molar bands, and form-fitted behind the teeth. ...

the orthodontist. The teeth and jaws can only move toward their corrected positions if the patient consistently wears the elastics (rubber bands), headgear, or other appliances as prescribed.

Types of Appliances - Studebaker Orthodontics | Spring TX

Orthodontic technology is a specialty of dental technology that is concerned with the design and fabrication of dental appliances for the treatment of malocclusions, which may be a result of tooth irregularity, disproportionate jaw relationships, or both. There are three main types of orthodontic appliances: active, passive and functional. All these types can be fixed or removable.
