probability. In this court case, the prosecution used two different types of arguments to provide evidence of cheating. The first argument is an example of statistical inference because it is based on probability. We set up a simulation to reflect an assumption that the prosecutor made.

### **Why It Matters: Linking Probability to Statistical Inference**

Inferential statistics is the other branch of statistical inference. Inferential statistics help us draw conclusions from the sample data to estimate the parameters of the population. The sample is very unlikely to be an absolute true representation of the population and as a result, we always have a level of uncertainty when drawing conclusions about the population.

Many courses are given in statistical method. Elementary probability considers only finite sample spaces; advanced probability by use of calculus studies infinite sample spaces. The theory of probability was first developed (c.1654) by Blaise Pascal, and its history since then involves the contributions of many of the world's great mathematicians.

Bayesian inference derives the posterior probability. It assumes that the posterior probability is a result of two main inputs (for simplicity): a prior probability and a likelihood function. The likelihood function is derived from a statistical model itself. Bayesian inference computes the posterior probability according to Bayes' theorem.

### **Statistical inference - Wikipedia**

Statistical inference is meant to be “guessing” about something about the population. There are several techniques to analyze the statistical data and to make the conclusion of that particular data. In this post, we will discuss the inferential statistics in detail that includes the definition of inference, types of it, solutions, and examples of it.

Sampling in Statistical Inference The use of randomization in sampling allows for the analysis of results using the methods of statistical inference. Statistical inference is based on the laws of probability, and allows analysts to infer conclusions about a given population based on results observed through random sampling.
