Additionally, in a 2009 study, eighth graders who took a practice test halfway through the year remembered 10 percent more facts on a U.S. history final at the end of the year than peers who studied but took no practice test. Short, low-stakes tests also help teachers gauge how well students understand the material and what they need to reteach.

The Supreme Court's decision invalidated those gene patents, making the genes accessible for research and for commercial genetic testing. The Supreme Court's ruling did allow that DNA manipulated in a lab is eligible to be patented because DNA sequences altered by humans are not found in nature.

Property Testing is concerned with approximate decisions, where the task is distinguishing between objects having a predetermined property and objects that are "far" from having this property. Typically, objects are modeled by functions, and distance between functions is measured as the fraction of the domain on which the functions differ.

Property-based tests are designed to test the aspects of a property that should always be true. They allow for a range of inputs to be programmed and tested within a single test, rather than having to write a different test for every value that you want to test. Property-based testing was popularized by the Haskell library QuickCheck.
