Similar to scientific notation, unit prefixes make very large and very small number easier to manipulate and to understand. Converting numbers from one metric prefix to another is a common task in many areas of science. For example, a lab may stock a 10 gram per liter (g/l) solution of glucose, while a particular procedure may require a 100  $\mu\text{g/l}$  of glucose solution.

Scientific Notation The easiest way to convert one unit of measurement to another unit of measure is to initially convert its metric prefix to its associated power of ten while also rewriting the original numerical value in scientific notation. The final answer can then be simplified by just combining exponents.

A metric prefix is a unit prefix that precedes a basic unit of measure to indicate a multiple or submultiple of the unit. All metric prefixes used today are decadic. Each prefix has a unique symbol that is prepended to any unit symbol. The prefix kilo-, for example, may be added to gram to indicate multiplication by one thousand: one kilogram is equal to one thousand grams. The prefix milli-, likewise, may be added to metre to indicate division by one thousand; one millimetre is equal to one tho
