Design & Implementation Verification of Class Files and Byte Code Java compilers are required to generate code that satisfies all the constraints defined by the Java class file specification. These include well-formedness of the internal data structures, type safety, definite assignment, and lack of underflow or overflow in the operand stack.

In this paper, we present the design and implementation of a new mechanism, hypercalls, which enables a hypervisor to safely execute verified code provided by a guest virtual machine in order to transfer information. Hypercalls are written in C and have complete access to guest data structures such as page tables.
